McAfee Embedded Control
System integrity, change control, and policy compliance in one solution

McAfee® Embedded Control maintains the integrity of your system by only allowing authorized code to run and only authorized changes to be made. It automatically creates a dynamic whitelist of the "authorized code" on the embedded system. Once the whitelist is created and enabled, the system is locked down to the known good baseline, no program or code outside the authorized set can run, and no unauthorized changes can be made. McAfee Integrity Control—which combines McAfee Embedded Control and the McAfee ePolicy Orchestrator® (McAfee ePO™) console—provides integrated audit and compliance reports to help you satisfy multiple compliance regulations.

Key Advantages
- Minimize your security risk by controlling what runs on your embedded devices and protecting the memory in those devices
- Give access, retain control, reduce support costs
- Selective enforcement
- Deploy and forget
- Make your devices compliance and audit ready
- Real-time visibility
- Comprehensive audit
- Searchable change archive
- Closed-loop reconciliation

McAfee Embedded Control focuses on solving the problem of increased security risk arising from the adoption of commercial operating systems in embedded systems. McAfee Embedded Control is a small-footprint, low-overhead, application-independent solution that provides "deploy-and-forget" security. McAfee Embedded Control converts a system built on a commercial operating system into a "black box" so it looks like a closed proprietary operating system. It prevents any unauthorized program that is on disk or injected into memory from executing and prevents unauthorized changes to an authorized baseline. This solution enables manufacturers to enjoy the benefits of using a commercial operating system without incurring additional risk or losing control over how systems are used in the field.

Assured System Integrity
Executable control
With McAfee Embedded Control, only programs contained in the McAfee dynamic whitelist can execute. Other programs (exes, dlls, scripts) are considered unauthorized. Their execution is prevented, and the failure is logged by default. This prevents worms, viruses, spyware, and other malware that install themselves from executing illegitimately.

Memory control
Memory control ensures that running processes are protected from malicious attempts to hijack them. Unauthorized code injected into a running process is trapped, halted, and logged. This way, attempts to gain control of a system through buffer overflow, heap overflow, stack execution, and similar exploits are rendered ineffective and are logged.[1]
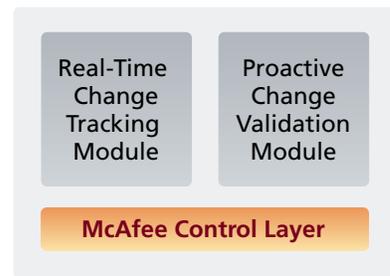

Change control
McAfee Embedded Control detects changes in real time. It provides visibility into the sources of change and verifies that changes were deployed onto the correct target systems; provides an audit trail of changes; and allows changes to be made only through authorized means.

It allows you to enforce change control processes by specifying the authorized means of making changes. You may control who can apply changes, which certificates are required to allow changes, what may be changed (for example, you may restrict changes to certain files or directories), and when changes may be applied (for example, update windows may only be opened during certain times of the week).

[1] Only available on Microsoft Windows platforms.

Proactive change verifies each change before it is applied on target systems. With this module enabled, updates to software systems may only be made in a controlled manner.

The real-time change tracking module logs all changes to system state, including code, configuration, and the registry. Change events are logged as they occur, in real time, and sent to the system controller for aggregation and archival purposes.

Real-Time Change Tracking Module	Proactive Change Validation Module
McAfee Control Layer	

*Change Agent
Deployed on Endpoints*

The system controller module manages communication between the system controller and the agents. It aggregates and stores change event information from the agents in the ISR.

Audit and Policy Compliance
McAfee Integrity Control provides dashboards and reports that help you meet compliance requirements. These are generated through the McAfee ePO console, which provides a web-based UI for users and administrators.

McAfee Embedded Control delivers integrated, closed-loop, real-time compliance and audit, complete with a tamperproof system of record for the authorized activity and unauthorized attempts.

About McAfee Embedded Security
McAfee Embedded Security solutions help manufacturers ensure that their products and devices are protected from cyberthreats and attacks. McAfee solutions span a wide range of technologies, including application white-listing, anti-virus and anti-malware protection, device management, encryption, and risk and compliance—and all leverage the industry-leading McAfee Global Threat Intelligence™. Our solutions can be tailored to meet the specific design requirements for a manufacturer's device and its architectures.

Feature	Description	Benefit
Guaranteed System Integrity		
External threat defense	Ensures that only authorized code can run. Unauthorized code cannot be injected into memory. Authorized code cannot be tampered with.	• Eliminates emergency patching, reduces number and frequency of patching cycles, enables more testing before patching, reduces security risk for difficult-to-patch systems • Reduces security risk from zero-day, polymorphic attacks via malware such as worms, viruses, Trojans; code injections like buffer-overflow, heap overflow, and stack-overflow • Maintains integrity of authorized files, ensuring the system in production is in a known and verified state • Reduces cost of operations via both planned patching and unplanned recovery downtime and improves system availability
Internal threat defense	Local administrator lockdown gives the flexibility to disable even administrators from changing what is authorized to run on a protected system, unless presented by an authentic key.	• Protects against internal threat • Locks down what runs on embedded systems in production and prevents change even by administrators
Advanced Change Control		
Secure authorized updates by manufacturer	Ensures that only authorized updates can be implemented on in-field embedded systems.	• Ensures that no out-of-band changes can be deployed on systems in the field. Prevents unauthorized system changes before they result in downtime and generate support calls. • Manufacturers can choose to retain control over all changes themselves, or authorize only trusted customer agents to control changes
Verify that changes occurred within approved window	Ensure that changes were not deployed outside of authorized change windows.	• Prevent unauthorized change during fiscally sensitive time windows or during peak business hours to avoid operational disruption and/or compliance violations
Authorized updaters	Ensure that only authorized updaters (people or processes) can implement changes on production systems.	• Ensure that no out-of-band changes can be deployed on production systems
Real-Time, Closed Loop, Audit and Compliance		
Real-time change tracking	Track changes as soon as they happen across the enterprise.	• Ensure that no out-of-band changes can be deployed on production systems
Comprehensive audit	Capture complete change information for every system change: who, what, where, when, and how.	• An accurate, complete, and definitive record of all system changes
Identify sources of change	Link every change to its source: who made the change, the sequence of events that led to it, the process/program that affected it.	• Validate approved changes; quickly identify unapproved changes; increase change success rate

Low Operational Overhead		
Deploy and forget	Software installs in minutes, no initial configuration or setup necessary. No ongoing configuration necessary.	• Works out of the box. Effective immediately after installation. Does not have any ongoing maintenance overhead, thereby favorable choice for a low OpEx security solution configuration.
Rules-free, signature-free, no learning period, application independent	Does not depend on rules or signature databases; is effective across all applications immediately with no learning period.	• Needs very low attention from an administrator during server lifecycle • Protects server until patched or unpatched server with low ongoing OpEx • Its effectiveness does not depend on quality of any rules or policies
Small footprint, low runtime overhead	Takes up less than 20 MB disk space. Does not interfere with application's runtime performance.	• Ready to be deployed on any mission-critical production system without impacting its run-time performance or storage requirements
Guaranteed no false positives or false negatives	Only unauthorized activity is logged.	• Accuracy of results reduces OpEx as compared to other host intrusion prevention solutions by dramatically reducing the time needed to analyze logs daily/weekly • Improves administrator efficiency, reduces OpEx
